## PATENT CLAIMS

- Method for storing video signals with the aid of a random access memory (SDRAM) that is operated synchronously during writing and reading, there being connected downstream of the random access memory a further memory (FIFO) with different frequencies for writing and reading, characterised in that the video signals to be stored are divided 10 into a plurality of parallel data streams, in that the data streams are time-compressed in such a way that the compressed data streams take up only a part of a predetermined write-read cycle for the random access memory, in that data streams read 15 from the random access memory are conducted via the further memory and combined to form video signals.
- Method according to Claim 1, characterised in
   that the write-read cycle comprises a write period and at least one read period.
- Method according to Claim 2, characterised in that the write-read cycle comprises a write period
   and three read periods.
- Method according to either of Claims 2 and 3, characterised in that the write or read periods in each case contain, prior to the writing or reading, respectively, control time segments for setting the random access memory for writing or reading, respectively, and, after the write or read periods, respectively, control time segments for terminating the writing or reading, respectively.

9

5. Method according to Claim 4, characterised in that the random access memory is furthermore refreshed in the time segments.

- 5 6. Method according to one of the preceding claims, characterised in that, in the control time segments preceding the writing or reading, the following code sequence is fed to the random access memory: NOPs, PALL, NOPs, REF, ACTV, ACTV, 10 NOPs.
- 7. Method according to one of the preceding claims, characterised in that, in the control time segments after writing or reading, the following code sequence is fed to the random access memory:

  BST, PALL, REF, NOPs.
- Method according to one of the preceding claims, characterised in that the video signals
   are divided pixel by pixel.
